```
class JLiteralString  
extends JExpression
```

The AST node for a string literal.

- **Constructor Summary**

Constructors
Constructor and Description

```
JLiteralString(int line, String text)
```

Construct an AST node for a string literal given its line number and string representation.

- **Method Summary**

Methods	
Modifier and Type	Method and Description
JExpression	analyze (Context context) Analyzing a String literal is trivial.
void	codegen (CLEmitter output) Generating code for a string literal means generating code to push it onto the stack.
void	writeToStdOut (PrettyPrinter p) Write the information pertaining to this AST to STDOUT.

- **Constructor Detail**

- **JLiteralString**

public JLiteralString(int line, String text)

Construct an AST node for a string literal given its line number and string representation.

Parameters:

line - line in which the literal occurs in the source file.
text - representation of the literal.

- **Method Detail**

- **analyze**

public JExpression analyze(Context context)

Analyzing a String literal is trivial.

Specified by:

analyze in class JExpression

Parameters:

context - context in which names are resolved (ignored here).

Returns:

the analyzed (and possibly rewritten) AST subtree.

- **codegen**

public void codegen(CLEmitter output)

Generating code for a string literal means generating code to push it onto

the stack.

Specified by:

`codegen` in class `JAST`

Parameters:

output - the code emitter (basically an abstraction for producing the .class file).

- **writeToStdOut**

```
public void writeToStdOut(PrettyPrinter p)
```

Description copied from class: `JAST`

Write the information pertaining to this AST to STDOUT.

Specified by:

`writeToStdOut` in class `JAST`

Parameters:

p - for pretty printing with indentation.
