Serialized Form

- ## Package jminusminus

  - ### Class jminusminus.ParseException extends Exception implements Serializable

  - ### Serialized Fields

    - #### specialConstructor

      `boolean specialConstructor`

      This variable determines which constructor was used to create this object and hereby affects the semantics of the "getMessage" method (see below).

    - #### currentToken

      `Token currentToken`

      This is the last token that has been consumed successfully. If this object has been created due to a parse error, the token followng this token will (therefore) be the first error token.

    - #### expectedTokenSequences

      `int[][] expectedTokenSequences`

      Each entry in this array is an array of integers. Each array of integers represents a sequence of tokens (by their ordinal values) that is expected at this point of the parse.

    - #### tokenImage

      `String[] tokenImage`

      This is a reference to the "tokenImage" array of the generated parser within which the parse error occurred. This array is defined in the generated ...Constants interface.

    - #### eol

      `String eol`

      The end of line string for this machine.

- **Class jminusminus.TokenMgrError extends Error implements Serializable**

- **Serialized Fields**

  - **errorCode**

    ```
    int errorCode
    ```

    Indicates the reason why the exception is thrown. It will have one of the above 4 values.
